## **BEST AVAILABLE IMAGES**

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

**IMAGES ARE BEST AVAILABLE COPY.**

**As rescanning documents *will not* correct images,  
please do not report the images to the  
Image Problem Mailbox.**

### SUPPORT FOR THE AMENDMENT

This Amendment adds new Claims 31-32. Support for the amendments is found in the specification and claims as originally filed. In particular, support for new Claim 31 is found in Claim 5 and in the specification at least at page 15, lines 1-8. Support for new Claim 32 is found in Claim 5. No new matter would be introduced by entry of these amendments.

Upon entry of these amendments, Claims 1-7, 9, 11-20 and 28-32 will be pending in this application. Claims 1, 5, 6 and 31-32 are independent. Claims 9, 14-20 and 28-30 are withdrawn from consideration.

### REQUEST FOR RECONSIDERATION

Applicants respectfully request entry of the foregoing and reexamination and reconsideration of the application, as amended, in light of the remarks that follow.

Applicants thank the Examiner for the courtesies extended to their representative during the May 12, 2004, personal interview.

As discussed at the personal interviews, the present invention provides polishing liquid compositions that, when used to polish a surface comprising an insulating layer and a metal layer, prevents the occurrence of dishing.

Claims 1-3, 7 and 11 are rejected under 35 U.S.C. § 103(a) over U.S. Patent No. 6,383,240 ("Nishimoto"). Applicants respectfully traverse the rejection because Nishimoto is not prior art to the above-identified application. Nishimoto was filed on September 29, 2000. In contrast, the effective U.S. filing date of the above-identified national stage application is the international filing date of July 7, 2000. See, e.g., M.P.E.P. at page 700-21, column 2; and § 1893.03(b). Because Nishimoto was filed after the effective U.S. filing date of the

above-identified application, Nishimoto is not prior art to the above-identified application.

Thus, the rejection over Nishimoto should be withdrawn.

Claims 5 and 12 are rejected under 35 U.S.C. § 102(b) over U.S. Patent No. 5,783,489 ("Kaufman-489"). Kaufman-489 discloses a chemical mechanical polishing (CMP) slurry comprising at least two oxidizing agents, an organic acid and an abrasive. Kaufman-489 at abstract. Kaufmann-489 discloses:

The CMP slurry of this invention includes an organic acid. A wide range of conventional organic acids, salts of organic acids, and mixtures thereof are useful in the CMP slurry of the present invention to enhance the selectivity to oxide polishing rate, such as monofunctional acids, di-functional acids, hydroxyl/carboxylate acids, chelating, non-chelating acids, and their salts. Preferably, the organic acid is selected from the group of acetic acid<sup>\*2</sup>, adipic acid<sup>\*2</sup>, butyric acid<sup>\*2</sup>, capric acid<sup>\*1</sup>, caproic acid<sup>\*2</sup>, caprylic acid<sup>\*1</sup>, citric acid<sup>\*2</sup>, glutaric acid<sup>\*2</sup>, glycolic acid<sup>\*2</sup>, formic acid<sup>\*2</sup>, fumaric acid<sup>\*2</sup>, lactic acid<sup>\*2</sup>, lauric acid<sup>\*1</sup>, malic acid<sup>\*2</sup>, maleic acid<sup>\*2</sup>, malonic acid<sup>\*2</sup>, myristic acid<sup>\*1</sup>, oxalic acid<sup>\*2</sup>, palmitic acid<sup>\*1</sup>, phthalic acid<sup>\*2</sup>, propionic acid<sup>\*2</sup>, pyruvic acid<sup>\*2</sup>, stearic acid<sup>\*1</sup>, succinic acid<sup>\*2</sup>, tartaric acid<sup>\*2</sup>, valeric acid<sup>\*2</sup> and derivatives, including salts thereof.

The organic acid or salt should be present in the final CMP slurry, individually or in combination with other organic acids or salts, in an amount sufficient to enhance the oxide selectivity without detrimentally effecting the stability of the CMP slurry. Kaufmann-489 at column 6, lines 1-19 (umbered asterisks added).

In the passage above, an acid designated \*1 belongs to independent Claim 5's aliphatic carboxylic acids having 7 to 24 carbon atoms and an acid designated \*2 belongs to Claim 5's etching agent.

However, Kaufmann-489 fails to disclose or exemplify the specific combination of acids of independent Claim 5 of an (i) aliphatic carboxylic acid having 7 to 24 carbon atoms and/or a salt thereof and (ii) the recited etching agent. Claim 5's acids synergistically combine to maintain a practical polishing speed while avoiding excessive etching of a metal layer, which leads to undesirable dishing. See, e.g., specification at page 18, lines 1-10. Given the large number of acid combinations possible from Kaufman-489's list of acids, there is no reasonable expectation that Kaufman-489 would successfully lead the skilled artisan to

the Claim 5 combination of acids (i) and (ii) necessary to both maintain polishing speed and prevent dishing. A system of glycolic acid and citric acid, both of which belong to the Claim 5 group (ii) of etching agents and appear in Kaufman-489's list of acids, fails to prevent dishing. See, Comparative Example II-6 in the specification at Table 4, reproduced below. Since Kaufman-489 fails to suggest all the limitations of independent Claim 5, the rejection under 35 U.S.C. § 102(b) over Kaufman-489 should be withdrawn.

Any *prima facie* case for the obviousness of independent Claim 5 is rebutted by the significant reduction in dishing achieved by Claim 5's specific combination of (i) "an aliphatic carboxylic acid having 7 to 24 carbon atoms and/or a salt thereof" and (ii) "an etching agent comprising an organic acid" from the recited Markush group. See the Examples and Comparative Examples of Tables 3 and 4, which are reproduced below.

Note 1): % by weight

Because Kaufman-489 fails to suggest the significant reduction in dishing achieved by independent Claim 5's specific combination of (i) "an aliphatic carboxylic acid having 7 to 24 carbon atoms and/or a salt thereof" and (ii) "an etching agent comprising an organic acid" from the recited Markush group, any *prima facie* case of obviousness based on Kaufman-489 is rebutted. Thus, Kaufman-489 fails to have rendered obvious independent Claim 5.

Claims 6 and 13 are rejected under 35 U.S.C. § 102(e) over U.S. Patent No. 6,063,306 ("Kaufman-306"). Kaufman-306 discloses a chemical mechanical polishing slurry that can include an organic amino compound such as nonylamine and dodecylamine. Kaufman-306 at column 6, lines 12-13. However, the singly substituted alkylamines of Kaufman-306 (see definitions of "nonylamine" and "dodecylamine" in Handbook of Chemistry and Physics, 52d edition, pages C-274 and C-394, copies attached) fail to suggest the triply substituted amine compound of independent Claim 6. Thus, the rejection over Kaufman-306 should be withdrawn.

Pursuant to M.P.E.P. § 821.04, after independent product Claims 1, 5 and 6 are allowed, Applicants respectfully request rejoinder, examination and allowance of withdrawn method Claims 9, 14-20 and 28-30, which include all of the limitations of independent product Claims 1, 5 and 6, respectively.

In view of the foregoing amendment and remarks, Applicants respectfully submit that the application is in condition for allowance. Applicants respectfully request favorable consideration and prompt allowance of the application.

Should the Examiner believe that anything further is necessary in order to place the application in even better condition for allowance, the Examiner is invited to contact Applicants' undersigned attorney at the telephone number listed below.

Respectfully submitted,

OBLON, SPIVAK, McCLELLAND,  
MAIER & NEUSTADT, P.C.
